

ECONOMIC VALUE COMPOUNDED™ (EVC)

Economic Value Compounded™ (EVC) Methodology is developed by building the learning health systems that integrate clinical care, clinical research, and public health on one side while converging chronic diseases and health disparities, translational research, and personalized medicine on the other side.

This is delivered by CTIS' trademark methodology in providing a substantial economic value beyond simple economic benefit by creating and integrating process streamlining, technology integration, providing best information on-time to the right stakeholders, and best practice trained human resources. This mechanism increases financial returns by building process capital, human capital, technology capital, and information capital by providing a very high Return on Investment and Innovation (ROI), which is dubbed as EVC.

CTIS has domain expertise in various areas such as: program management and earn value management; data warehousing, data mining, and business intelligence; health information exchange; IT infrastructure and managed hosting; software development, operations and maintenance; customer service, communication, training and documentation; system integration and commercial off-the-shelf integration; business process re-engineering and business analysis; and portals and dashboards and mobile applications.

This expertise is delivered through people who are trained in best practices and standards in each area, as provided in the Best Practices EnSURE™ Section. All of this is ultimately built on the Good Clinical Technical Services platform and the Good Clinical Informatics framework, delivering the highest ROI and economic value management.
